REVENUE MODEL · IN THE OPEN

How GoodStrata makes money — in the open

Traditional strata management hides its economics: a manager earns invisible commissions on the insurance it places and quiet kickbacks from the contractors it appoints. You never see those numbers. GoodStrata is built the opposite way — we take none of that, and the little we do earn is a transparent margin on money that actually moves, recorded to the cent on an audit log you can read.

Free for owners corporations

GoodStrata is open source and free for owners corporations to run. There is no per-lot licence fee and no charge for the software itself. Two ways to use it, both free at the point of governance:

- Self-host. Run the platform on your own infrastructure. You hold the data and the keys. Nothing is billed to the owners corporation.
- Hosted free tier. Let us host it for you at no cost — the same software, run for schemes that would rather not operate servers.

The agents do the operational work; committee members and owners only approve, vote, or escalate. The software being free is the point: it removes the incentive to earn money in the places a manager traditionally hides it.

Where the money actually comes from

GoodStrata earns in two plain ways. Both are visible, both scale only with real activity, and neither depends on which insurer or contractor a scheme chooses.

1

PAYMENT PROCESSING MARGIN

A small margin on payments that move

Primarily on inbound levy payments made over the NPP via PayID, settled through Monoova — plus a margin on outbound contractor payments. It is a thin, disclosed processing margin on money the owners corporation was always going to move. When no money moves, we earn nothing.

2

MANAGED SERVICE

A paid hosted service, for those who want it

For owners corporations that would rather not self-host, we run and maintain the platform as a paid managed service. It is priced openly — an optional operational service, not a commission and not tied to any supplier decision.

THE TRANSPARENCY WEDGE

What we will never do

The conflict of interest that defines traditional strata management is that the manager gets paid more when it steers your decisions — toward the insurer that pays the best commission, the contractor that returns the best favour. GoodStrata structurally refuses those revenue lines. These are commitments, enforced by how the software is built, not just promises:

No hidden insurance commissions.
We do not take a cut of the premiums placed for your building. The certificate of currency and the full cost sit in front of the committee — nothing is skimmed on the way.

No biased contractor kickbacks.
We accept no referral fees, rebates, or 'preferred supplier' payments from the tradespeople who do your maintenance. What a contractor is paid is what they quoted.

No margin-ranked recommendations.
The AI never ranks or recommends a contractor by what GoodStrata would earn. Options are presented on their attached evidence — quotes, scope, availability, history — and the committee chooses. Our earnings never touch the ordering.

	TRADITIONAL MANAGER	GOODSTRATA
Insurance commission	Undisclosed % of premium	None — full cost shown
Contractor kickbacks	Referral fees & rebates	None — quoted price only
Who ranks suppliers	Manager, reasons unseen	Committee, on evidence
Software cost to OC	Bundled into fees	Free · open source
What we earn on	Hidden commissions	Disclosed payment margin
Where it's recorded	Rarely, if ever	Append-only audit log

The result: advice you can trust because we don't profit from it.
Because our revenue doesn't depend on which insurer or contractor you pick, the recommendation you get is the one the evidence supports — not the one that pays us. That is the whole design.

PROOF, NOT PROMISES

How you can verify it

Trust in strata should not require taking anyone's word for it — least of all a manager's. Everything above is checkable, by design. Two mechanisms make our economics auditable down to each action:

A

THE AUDIT LOG

Every action is an event you can read

The whole platform runs on an append-only event log. Each levy raised, payment settled, contractor engaged, and dollar of margin taken lands as an immutable event — down to each model tool-call. Money math is deterministic, tested code, never the language model. Nothing about how we earn is off the record.

B

OPEN SOURCE

Read the code that runs your building

GoodStrata is open source. You — or anyone you trust — can inspect exactly how levies are calculated, how payments are routed, where the processing margin is applied, and confirm there is no hidden commission logic anywhere in it. The claims on this page are enforced by code you can read, fork, and self-host.

In one line

GoodStrata is free for owners corporations, earns only a transparent margin on payments that move plus an optional paid hosted service, takes no insurance commissions and no contractor kickbacks, never lets its own earnings rank a recommendation – and puts every dollar on an audit log you can read.

Learn more, read the code, or run it yourself at **goodstrata.com.au**. This document reflects the GoodStrata money model as published; the platform is built for the Victorian Owners Corporations Act 2006 first.
